## **DETAILED ACTION**

### ***Response to Arguments***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 01/05/2010 has been entered.

### ***Claim Status***

2. Claims 2-10 and 17-24 are currently pending in the instant application. Claims 1, 11-16 and 25-31 have been cancelled.

### ***Reasons for Allowance***

3. Claims 2-10 and 17-24 are allowed over the prior art record.
4. The following is an examiner's statement of reasons for allowance:

The applicant's request for continued examination (RCE), filed on 01/05/2010, have been carefully reviewed with updated search. Consequently, reasons for allowance of claims 2-10 and 17-24 are set forth in according with the following:

**Hansen et al. (US PAT. 7,324,785 hereinafter, "Hansen")** teaches controlling transmit power of a wireless communication device includes processing that begins when a transmitting wireless communication device transmits a packet to a targeted wireless device via a wireless channel of a communication system at a 1st power level. The processing continues by having the targeted wireless device determining signal strength of the packet received via the wireless channel. The processing then continues when the targeted and/or transmitting device determines the adequacy of the 1st power level based on the determined signal strength. If the 1st power level is adequate, the transmitting wireless device continues to transmit information at the 1st power level. If, however, the 1st power level is not adequate, the transmitting communication device adjusts its transmit power up or down to provide an adequate power level.

**Lee et al. (US PAT. 7,158,812 hereinafter, "Lee")** teaches measuring output power of a pilot channel transmitted from a CDMA (code division multiple access) base station. The method for measuring transmission output power of the base station in a forward link from the CDMA base station to at least one mobile station, includes receiving output power of the base station, measuring the total output power outputted from the base station by means of an output power level measurement unit and at the same time dividing and measuring the output power of the base station in the same time zone according to each code by means of a code domain analyzer, evaluating a proportion which the pilot channel accounts for with respect to all code domains, and evaluating only output power of the pilot channel by multiplying the proportion of the pilot channel by the total output power of the base station.

Consider claims 2-10, the prior arts made of record, alone or in combination, fails to clearly teach or fairly suggest the base station comprises at least one power monitor and adjustment (PMA) module adapted to handle one or more requests from the remote unit, wherein the power monitor and adjustment module are adapted to toggle at least one input port between a calibration mode of operation and a normal mode of operation, wherein the power monitor and adjustment module are adapted to provide a signal to a power measuring module adapted to measure power; wherein measuring the power level comprises measuring the power level of at least two communication channels; and further determining if the measured power level is within an acceptable range, wherein determining comprises at least one of comparing the measured power level to a pre-defined value at the power monitor adjustment module, comparing, at the power monitor adjustment module, the measured power level to a range of acceptable values provided by the remote unit, and comparing the measured power level to a value at the remote unit, in combination with other limitations, as specified in the independent claim 2, and further limitations of their respective dependent claims 3-10.

Consider claims 17-24, the prior arts made of record, alone or in combination, fails to clearly teach or fairly suggest the base station comprises at least one power monitor and adjustment (PMA) module adapted to handle one or more requests from the remote unit, wherein the power monitor and adjustment module are adapted to toggle at least one input port between a calibration mode of operation and a normal mode of operation, wherein the power monitor and adjustment module are adapted to provide a signal to a power measuring module adapted to measure power; wherein

measuring the power level comprises measuring the power level of at least two communication channels; and further determining if the measured power level is within an acceptable range, wherein determining comprises at least one of comparing the measured power level to a pre-defined value at the power monitor adjustment module, comparing, at the power monitor adjustment module, the measured power level to a range of acceptable values provided by the remote unit, and comparing the measured power level to a value at the remote unit, in combination with other limitations, as specified in the independent claim 17, and further limitations of their respective dependent claims 18-24.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
